

DaVinci Resolve Removal and Closure Documentation

Date

June 1, 2026

Purpose

This procedure documents the approved removal of DaVinci Resolve from the Isaac Desktop workstation following troubleshooting analysis and management review. The removal was authorized after findings indicated that the workstation hardware, specifically the integrated GPU, may not adequately support stable DaVinci Resolve operation.

This project was completed collaboratively through teamwork between Joshua Ugborugbo and Jephete Fenelon during the troubleshooting, testing, documentation, and remediation process.

Management reviewed the troubleshooting results and approved the removal of the application after determining that the endpoint was likely being pushed beyond its supported hardware capabilities.

Team Collaboration

This troubleshooting and remediation project was completed through a collaborative team effort.

Team Members

- Joshua Ugborugbo
- Jephete Fenelon

Teamwork Contributions

Throughout the project, both team members worked together to:

- Troubleshoot DaVinci Resolve launch failures

- Investigate GPU and hardware limitations
- Review endpoint behavior through Action1
- Perform application reinstall and remediation attempts
- Document troubleshooting procedures
- Validate uninstall and cleanup procedures
- Review findings and final recommendations

The teamwork approach improved troubleshooting efficiency, documentation quality, and overall problem analysis during the investigation process.

Management Review and Approval

Following the troubleshooting investigation, management provided the following guidance:

“Thanks for the effort and the documentation. This is the standard of work I expect, and not just a one-line email saying it's not working. I think this is us pushing the limits of the device. Looking at the details of the analysis the GPU may not be able to handle the software. You guys can go ahead and uninstall Resolve. Well done on this exercise.”

Based on this assessment, approval was granted to remove DaVinci Resolve and related Blackmagic components from the workstation.

Step 1 — Open Control Panel

Actions Performed

1. Opened the Windows search bar.
2. Searched for:
 - Control Panel
3. Opened the Control Panel successfully.

Result

 Control Panel accessed successfully.

Step 2 — Open Programs and Features

Actions Performed

1. Selected:
 - Programs
2. Opened:
 - Programs and Features
3. Reviewed installed applications list.

Result

✓ Installed software list loaded successfully.

Step 3 — Locate DaVinci Resolve

Actions Performed

1. Scrolled through installed applications.
2. Located:
 - DaVinci Resolve
3. Confirmed the application was still installed on the workstation.

Result

✓ DaVinci Resolve identified successfully.

Step 4 — Uninstall DaVinci Resolve

Actions Performed

1. Right-clicked:
 - DaVinci Resolve

2. Selected:
 - Uninstall
3. Confirmed uninstall operation.
4. Followed the uninstall wizard.
5. Waited for the uninstall process to complete successfully.

Result

✓ DaVinci Resolve successfully removed from the workstation.

Step 5 — Remove Remaining Blackmagic Components

Actions Performed

1. Returned to:
 - Programs and Features
2. Reviewed remaining Blackmagic Design software.
3. Removed:
 - DaVinci Resolve Control Panels
 - Blackmagic RAW Player
4. Confirmed successful uninstall operations.

Result

✓ Remaining Blackmagic components removed successfully.

Step 6 — Verify Application Removal

Actions Performed

1. Opened:
 - C:\Program Files\Blackmagic Design\

2. Verified that the DaVinci Resolve installation folder had been removed.
3. Returned to:
 - Programs and Features
4. Confirmed DaVinci Resolve no longer appeared in the installed applications list.

Result

✅ Application removal verified successfully.

Final Status

Item	Status
Management Approval Received	✅ Complete
DaVinci Resolve Uninstalled	✅ Complete
Blackmagic Components Removed	✅ Complete
Removal Verification Completed	✅ Complete

Closure Notes

Management reviewed the troubleshooting findings and determined that the workstation hardware, specifically the integrated GPU, may not adequately support DaVinci Resolve performance requirements.

Based on the troubleshooting analysis and hardware limitations identified during testing, approval was granted to remove DaVinci Resolve from the endpoint.

The application and associated Blackmagic components were removed successfully, and the endpoint was verified after the uninstall process.

No further remediation was required, and the issue was formally closed.

Lessons Learned

This exercise provided practical experience with:

- Endpoint troubleshooting
- GPU compatibility analysis
- Remote administration through Action1
- Software remediation procedures
- Application uninstall and cleanup procedures
- Technical documentation and reporting
- Root cause analysis and escalation review
- Team collaboration and troubleshooting coordination

The troubleshooting process also reinforced the importance of detailed documentation, structured investigation procedures, teamwork, and proper validation during endpoint software testing and remediation activities.
